

CYBERSAFE SOLUTIONS

24/7/365 Endpoint Security Monitoring

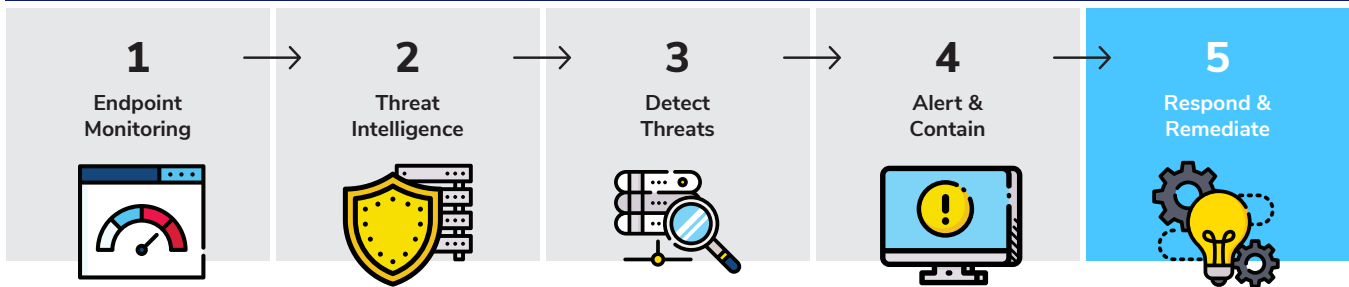

When you are under attack, every second counts.

Fully managed endpoint security monitoring

Cybersafe monitors your endpoints in real-time to identify threats and respond immediately. We isolate and contain attacks before data is exfiltrated, assets are further compromised, or irreversible damage is done.

Cybersafe's Endpoint Security Monitoring Service increases regulatory compliance and simplifies auditing for your organization.

CYBERSAFE ENDPOINT SECURITY MONITORING PLATFORM

Endpoints Are Prime Targets

Security for corporate desktops and laptops requires additional solutions beyond signature-based Anti-Virus, DLP, and Anti-Malware tools. Almost 40% of today's successful breaches begin with an endpoint attack.

Endpoint detection and response tools provide complete visibility into activity and are excellent supplements to traditional desktop protection.

Via a single endpoint platform, Cybersafe can monitor and protect all of your laptops, desktops, servers, and virtual environments, with support for all major operating systems. Cybersafe's comprehensive platform is an ideal solution for protecting enterprises' sensitive data from the ever-expanding threat landscape.

Take Control of Endpoint Security

Zero Day Attack Protection

We understand patterns of attack behavior and employ advanced behavioral analytics to detect and contain endpoint attacks.

Continuous Recording

Complete visibility into endpoint activity allows us to quickly pinpoint attacks and address gaps in defenses.

Threat Intelligence

Cybersafe works tirelessly with security professionals around the globe to identify new and emerging threats that target your endpoints.

Containment

This is a customized service that focuses on detection AND contains live attacks to stop adversaries in their tracks.

Threat Banning

Our team proactively bans the execution of known malicious files, stopping attacks before they begin.

Access Cybersafe's senior-level security experts with 20+ years of experience and a state-of-the-art Security Operations Center.

Cybersafe Endpoint Security Monitoring Features And Offerings:

Cybersafe has successfully responded to targeted attacks on our clients' endpoints. Our continuous recording and monitoring platform provides full visibility across the enterprise, enabling our analysts to determine the following:

- ✓ Adversaries, Tactics, Techniques, and Procedures (TTPs)
- ✓ Systems under attack
- ✓ Identification of command-and-control (C&C) servers
- ✓ Other endpoints where the same malware was spreading
- ✓ All IP addresses and domain names associated with the malware
- ✓ Reconnaissance activities of the attacker and which accounts the attacker was trying to access

Cybersafe Endpoint Security Monitoring Methodology

Our team's approach to Endpoint Security Monitoring incorporates the full security lifecycle of Prevention, Detection, and Incident Response. Prevention alone is no longer an effective security strategy. Cybersafe's security experts focus on detection in addition to prevention in order to keep your assets safe.

Cybersafe analysts utilize state-of-the-art detection and response tools that rapidly detect and contain threats before any damage occurs.

By proactively monitoring and recording all activity on endpoints and servers, our responders reduce the cost of incident response while also decreasing the dwell time of targeted threats through instant attack intervention and remediation.
